Overview

The Google SharePoint Sitemap (GSS) allows the Google Search Appliance and Google Mini to crawl data stored in Windows SharePoint Portal Server 2003 and Windows SharePoint Services based sites.

Key Features:

- Works with both Google Search Appliances and Google Minis
- Zero footprint required on SharePoint Servers
- Unlimited scalability for your SharePoint libraries and document libraries
- Can crawl with a simple user account without administrative rights
- Graphical interface and standard ASP.NET technologies

The Architecture

The GSS is deployed as a standard ASP.NET 2.0 application. It uses remote API calls to query your SharePoint system and builds lists of links which are presented to the Google crawlers for consumption. Using a recursive process, it's able to pull content nested in subfolders, sub-sites and other list.

Installation

The GSS can be installed in minutes with the installer and configurations to the web.config file. It uses standard IIS/ASP.NET security technologies allowing you, the customer, to decide the most effective deployment.

Professional Services

Should you require customizations to the Sitemap, SharePoint or additional connectors to you Google Search Appliance, our professional services team will be happy to assist you. Simply contact us at:
